IMP-G

LOW ENERGY TELESCOPE

69-053A-01A

THIS DATA SET HAS BEEN RESTORED. ORIGINALLY IT CONTAINED FORTY-THREE 7-TRACK, 800 BPI TAPES. THE FIRST 23 TAPES CONTAINED ONE FILE OF DATA. THE NEXT 20 TAPES WERE STANDARD LABELLED WITH THREE FILES EACH. THESE LABELS WERE STRIPPED AND JUST THE DATA FILE WAS LEFT. THERE ARE SEVEN RESTORED TAPES. THE DR TAPES ARE 3480 CARTRIDGES AND THE DS TAPES ARE 9-TRACK, 6250 BPI. THE ORIGINAL TAPES WERE CREATED ON A GE635 COMPUTER AND THEY WERE RESTORED ON THE MRS SYSTEM. THE DR AND DS NUMBERS ALONG WITH THE CORRESPONDING D NUMBERS AND THE TIME SPANS ARE AS FOLLOWS:

DR#	DS#	D#	FILES	TIME SPAN

EXPLORER 41

LOW ENERGY TELESCOPE

69-053A-01A

This data set consists of 43 Explorer 41 Low Energy Telescope tapes. These tapes are 800 BPI, Binary, 7-track, each containing one file of Low Energy Telescope Telemetry and Orbital data. They were originally created on a GE635 computer.

The physical records are variable length. The telemetry logical records are 10 words long and the orbital records are 20 words long.

The time spans for the tapes are:

D#	C#	TIME SPAN
D-09835	C-07930	6/21/69 - 7/08/69

IMP-G
Explorer 41 #201

DESCRIPTION OF BTL EXPLORER 34 AND 41 REDUCED DATA TAPES

The reduced-data tapes contain, in a compacted and time ordered form, the telemetry and orbital information relevant to the Bell Laboratories experiments on the satellites Explorer 34 and 41 (IMP-F and IMP-G). They are 7-track digital magnetic tapes recorded at 800 b.p.i. in odd parity (binary mode). The tape format is the GECOS Standard System Format (see the appendix) in which information is grouped into logical records. Two tapes of logical records can appear on a reduced-data tape: packed telemetry records and orbital information records. The record type is determined by the record size: the packed telemetry records are ten words long while the orbital information records are 20 words long. The packing scheme for the telemetry records is found in Table 1; the scheme for the orbital information records is found in Table 2.

The orbit data are given every 10 minutes, except when R< 42000 km, when the orbit data are given every minute. The orbital information records giving the orbit data are interspersed on the tape among the packed telemetry records in a special order with respect to time. The time value of any packed-telemetry record read from the tape will lie between the time values of the middle two of the last four orbital-information records read from the tape. An immediate consequence of this is that the first four logical records on a reduced data tape are orbital information records. With this scheme, interpolation of the orbital data to the exact time of a telemetry sequence can be easily accomplished.

---

*Separate, nearly identical, Explorer 34 and 41 descriptions generated by BTL personnel and merged at NSSDC.

since there are always four relevant points equally spaced in time. Care must be used in doing this since some of the orbital data items may be flagged as bad or unavailable data.

TABLE 1

Packed Telemetry Record

6	0-9	Real Flags for 5 Registers as they were read from telemetry record, 2 bits for each register
	10-11	0
	12-13	Pseudo-Sequence Clock Flag
	14-35	Pseudo-Sequence Clock
7	0-1	Optical Aspect Flag
	2-17	Optical Aspect Scan (0-180°. Binary Point 5 Places to the Left)
	18-19	Spin Period Flag
	20-35	Spin Period (msec) (2000-3000 msec)

---

* In the 16 bits of the register counts, if bits 1 and 2 of those bits = 1, in order to determine the register counts use the following formula:

Counts = 16383*RMAX/(RMAX-contents of bits 3 through 16) where RMAX = 14848. For example, if word 4 were 340,037,021,637 (octal), the 16 bits of the register count for register 2 would be 1100000000011111. Since bits 1 and 2 of these 16 bits are 1 the counts for register 2 would be calculated by

16383*14848/(14848-31).

Satellite Sequence and Calibrate Mode

If not in a calibrate mode, bits 31-35 of word 2 of a packed telemetry record determine the mode, according to the following table:

Bits 31-35	Mode	Bits 31-35	Mode
0	D	16	D
1	A	17	A
2	H	18	H
3	K	19	K
4	I	20	I
5	B	21	G
6	M	22	M
7	C	23	J
8	D	24	D
9	A	25	L
10	H	26	H
11	K	27	M
12	I	28	I
13	E	29	C
14	M	30	M
15	F	31	P

If in the calibrate mode, that is, if bits 25-29 of word 2 of a packed telemetry record are all ones,

bit 30=0 particle source in calibration

bit 30=1 test pulsar in calibration

If the satellite sequence (word 2) and pseudo-sequence clock (word 6) do not agree, use the satellite sequence for computations.

APPENDIX

GECOS Standard System Tape Format

A tape written as a GECOS standard system tape has three files, the first and last file being header and trailer labels, each containing one fourteen-word (one word=36 bits) record. The header and trailer labels contain information for use by the BTL Computation Center.

The second file contains the telemetry and orbital information in data blocks (physical records) of up to 320 words. The first word of each block contains the block serial number: bits 0-17 is the block serial number, the sequential number of the block (physical record) and bits 18-35 contain the block size. The block size is the number of 36-bit words not including the block-serial-number word in the record (e.g. if the block had 320 words, the block size would be 319 as the first word is the block serial number).

The logical records contained within each block are variable length and have a record size control word as the first word of each variable-length record. The contents of bits 0-17 of this control word give the binary equivalent of the record size in words not including the record size control word. The remainder of the word contains information for the GECOS system.
